Project Executable Files

Date	30 June 2026
Team ID	
Project Name	**Credit Card Approval Prediction**

Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA
5	Environment configuration file (.env.example or similar)	No
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

```
CREDIT_CARD_APPROVAL
  > .idea
  > .venv
  > dataset
  > model_training.py
  > models
  > notebooks
  > README.md
  > static
  > templates
  > venv
  .gitignore
  app.py
  Procfile
  requirements.txt
```

Step 3: Deployment / Access Details

Field	**Details**
Hosted / Deployed URL	https://credit-card-approval-prediction-0fb7.onrender.com
Login Credentials (Demo)	Not Required

Platform / Hosting Provider	Render
Repository Link	https://github.com/harshachettu/Credit-Card-Approval-Prediction-code

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

1. Clone the project repository from GitHub.
2. Open the project in Visual Studio Code.
3. Create and activate a Python virtual environment.
4. Install all required libraries using:

   pip install -r requirements.txt
5. Navigate to the Flask project folder.
6. Run the Flask application:

   python app.py
7. Open your browser and visit:

   http://127.0.0.1:5000
8. Click **Start Prediction**, enter the required applicant details, and click **Predict** to view whether the credit card application is **Approved** or **Rejected**..

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Prediction accuracy depends on the quality, completeness, and balance of the dataset used for training.	Can be improved by using a larger, more diverse, and up-to-date dataset and by performing further feature engineering.
2	The model performance may vary for applicants with very unusual or unseen patterns in the data.	Collect more real-world data and retrain the model periodically to improve generalization.
3	The application currently uses a limited set of machine learning algorithms (Logistic Regression, Decision Tree, Random Forest, XGBoost).	Additional advanced algorithms and ensemble techniques can be integrated in future versions for better accuracy and comparison.
4	No user authentication or prediction history storage is implemented.	Can be added in future using a database and login system to maintain user history and track past predictions.
5	The system is a web-based application and requires an active internet connection for deployment and access.	Future enhancement can include offline support or a mobile application for better accessibility.
6	The current system provides a binary output (Approved / Rejected) without detailed explanation of the decision.	Model interpretability techniques (such as SHAP or LIME) can be integrated in future to explain prediction reasons.
