

Brainstorming & Idea Prioritization

Date	26 June 2026
Team ID	
Project Name	Credit Card Approval Prediction
Maximum Marks	4 Marks

1. Team Gathering, Collaboration and Select the Problem Statement

The team came together for a structured brainstorming session to identify a real-world problem that could be meaningfully solved using machine learning. After discussing several pain points faced by banks and customers during the credit card application process, the team selected the problem of slow, inconsistent, and error-prone manual credit approval decisions as the focus area.

2. Brainstorm, Idea Listing and Grouping

Each team member contributed ideas individually, which were then grouped into themes on a shared board.

🔗 Prediction & Automation

- ML model to predict credit card approval/rejection instantly
- Automated risk scoring for applicants
- Batch screening tool for compliance officers

🔗 Customer Facing

- Self-service eligibility checker before formal application
- Chatbot to answer credit card queries
- Dashboard showing factors affecting approval

🔗 Risk & Fraud

- Credit card fraud/transaction anomaly detector
- High-risk applicant flagging system
- Loan default prediction model

🔗 Deployment & Access

- Flask web app for analysts and customers
- Cloud deployment via IBM Watson Machine Learning
- API for integration with banking systems

3. Idea Prioritization

Shortlisted ideas were scored against four criteria (1-5 scale, 5 = best) to identify the strongest concept to build: **Feasibility**, **Business Impact**, **Low Cost**, and **Time to Build**.

Idea	Feasibility	Impact	Low Cost	Time to Build	Total	Rank
Credit Card Approval Prediction (ML classifier + web app)	5	5	4	4	18	1
Loan Default Prediction Model	4	4	3	3	14	2
Customer Support Chatbot	4	3	4	4	15	2
Credit Card Fraud Detection	3	5	3	2	13	3
Credit Score Recommendation Engine	3	4	3	3	13	3

4. Final Selected Idea

✓ Credit Card Approval Prediction

A machine learning system that automates credit card approval decisions by training classification models (Logistic Regression, Random Forest, XGBoost, Decision Tree) on historical applicant data, then serving the best-performing model through a Flask web application, deployable on the cloud via IBM Watson Machine Learning. This idea scored highest on feasibility and business impact while remaining achievable within the project timeline.
