

Problem-Solution Fit

Date	04 July 2026
Team ID	
Project Name	Credit Card Approval Prediction
Maximum Marks	2 Marks

Customer Problem	Proposed Solution
Manual review of applications is slow and inconsistent	ML classification model trained on historical data automates the approve/reject decision instantly
No visibility into eligibility before formally applying	Self-service eligibility checker lets applicants get a prediction before submitting a formal application
Compliance officers must manually flag high-risk / past-due applicants	Batch screening feature classifies multiple applicants at once using engineered risk features
Approval criteria differ between individual reviewers	A single trained model applies the same criteria consistently to every applicant
On-premise systems can't easily scale to demand spikes	Cloud deployment via IBM Watson Machine Learning allows scalable, real-time access

Problem-Solution Fit Canvas

👤 Customer Segment

- Bank credit analysts and compliance officers
- Loan officers reviewing applicant risk
- Prospective credit card applicants

😞 Problem / Pain Points

- Time-consuming manual verification
- Inconsistent, error-prone decisions
- No pre-application eligibility insight

⚡ Existing Alternatives

- Fully manual credit review by analysts
- Static rule-based scorecards
- Generic credit-score-only checks

✔ Our Solution

- ML models (LR, RF, XGBoost, DT) trained on real financial features
- Flask web app for instant predictions
- Cloud-hosted for scalable, real-time use
